

CCP11 FISH Probe

Introduction

Chromosome counting probe 11 (CCP11) FISH Probe is designed to detect the copy number of chromosome 11 or to serve as a control to determine the relative number of copies of genes located on chromosome 11 or other chromosomes. The probe is derived from chromosome 11 specific alpha satellite DNA.

Intended Use
To measure the copy number of the human chromosome 11.

Probe Design

The CCP11 probe hybridizes to chromosome 11 in both metaphase and interphase cells. After hybridizing with normal human peripheral blood lymphocyte samples, two distinct bright fluorescent spots could be observed in the interphase nuclei under a fluorescence microscope. In metaphase cells, bright signals can be observed on the centromere region of chromosome 11 (11p11.1-q11.1). No cross-hybridization to loci on other chromosomes is observed.

Not to Scale

Cat. No.	Volume
CT-CCP011-10-G	10 Tests (100 µL)
